

Design Challenge

01/26/17, Revision 1.2

Challenge Overview and Background

The UX/UI design challenge is focused on a simple interaction of requesting time off from work. You will create deliverables, as you see fit, based on the following fictional project scenario.

Paylocity recognizes that taking time off is important for employees to maintain a proper work life balance but also knows that accruing, approving, and tracking is critical to the way businesses handle their payroll. In this design challenge help Paylocity meet these goals:

- Make it easy for employees to request and see status of a time off requests
- Provide a simple way for managers to approve or deny requests
- Handle customized restrictions and rules for new requests

Make best guess assumptions for any questions you have. Be prepared to discuss the questions in the context of how the assumptions relate to your design.

You are not expected to spend more than a few hours on this task. However, going above and beyond will not go unnoticed by the team.

Your Target Users:

Hourly & Salaried Employees – These users frequent the time off module to make requests, view accruals and understand restrictions. They are most likely to utilize the request function in addition to checking regularly to see their time off balance. Hourly employees often take note of their schedule as well where as salary employees do not.

Managers – Secondary user - These users, in addition to being an employee, have advanced functionality to approve and deny employee time off requests. They are most familiar with any restrictions a company may place on Time Off Requests.

Minimum Requirements

The UX/UI team at Paylocity is most interested in seeing your thought process and steps your take to solve complex UX problems like making time off requests. Given the limited amount of time expected for this assignment create a deliverable you are most comfortable speaking about and sharing with the team.

That could include:

A Heuristic Analysis, static wireframes, clickable prototype (axure, invision, etc), coded prototype, UI Designs or a presentation that walks us through your thinking.
